

## Distribution of PKC token

PiKaChu launched with a maximum total supply of 100 trillion on genesis, with 20% of the supply sent to a burn wallet as a deflationary force on the token. Every transaction with PKC incurs a 10% fee - 50% is locked in liquidity, 30% is directly distributed to all holders, and the remaining 20% is burned. With the total amount burned growing over time, the amount of available supply and yield generated decreases as the burn rate increases, forcing currency appreciation and asset-value protection.

Total Supply: 100,000,000,000,000

Initial Supply Burn: 20,000,000,000,000

Fair Launch Supply: 80,000,000,000,000

PiKaChu employs 3 simple functions: Reflection + Liquidity Pool

Acquisition + Burn in each trade. The transaction is taxed a 10% fee, which is split as follows:

- 3% distributed to PKC holders.
- 5% is redistributed and paired together in the Liquidity Pool.
  - 2.5% is sold by the contract into HT.
  - 2.5% is left in PKC to pair with HT.
- 2% is sent to a “dead” burn wallet.
